**Subject:**

Request for Site-Specific Treatability Variance for Acrylic Acid in Soils  
Eunice Train Derailment, May 27, 2000  
Agency Interest No. ~~82576~~ **85276**

Dear Mr. Vince:

ARCADIS is submitting this petition for a site-specific variance from the treatability standard for acrylic acid for the soils at the Eunice, Louisiana site on behalf of the Union Pacific Railroad Company (UPRR). Specifically the petition is submitted in accordance with LAC 33:V.2231.G, the applicable sections of which are shown below.

G. Based on a petition filed by a generator or treater of hazardous waste, the administrative authority may approve a site-specific variance from an applicable treatment standard if:

1. (Not Applicable); or
2. it is inappropriate to require the waste to be treated to the level specified in the treatment standard or by the method specified as the treatment standard, even though such treatment is technically possible. To show that this is the case, the petitioner must either demonstrate that:
  - a. treatment to the specified level or by the specified method is technically inappropriate (e.g., resulting in combustion of large amounts of mildly contaminated environmental media where the treatment standard is not based on combustion of such media); or
  - b. (Not Applicable);
3. for contaminated soil only, treatment to the level or by the method specified in the soil treatment standard would result in concentrations of hazardous constituents that are below (i.e., lower than) the concentrations necessary to minimize short and long term threats to human health and the environment. Treatment variances approved under this Subsection must:
  - a. at a minimum, impose alternative land disposal restriction treatment standards that, using a reasonable maximum exposure scenario:

- i. (Not Applicable);
- ii. for constituents with noncarcinogenic effects, achieve constituent concentrations that an individual could be exposed to on a daily basis without appreciable risk of deleterious effect during a lifetime;
- b. not consider post-land-disposal controls;

The information specifically requested in LAC 33:1.907.C. and the above specified sections of LAC 33:V.2231.G is provided below.

**I. Petitioner's Name and Address (§ 907.C.1.)**

Union Pacific Railroad  
24125 Aldine Westfield Road  
Spring, Texas 77373-9015  
Contact: Geoffrey Reeder

**II. Petitioner's Interest in the Proposed Action (§ 907.C.2.)**

UPRR is the generator of a large volume of impacted soil media from a train derailment site northwest of the town of Eunice, Louisiana. Approximately 1,500 tons of this soil has been mildly contaminated by acrylic acid (U008). UPRR has undertaken the clean up environmental media at the site impacted by the chemicals carried in the derailed railcars.

**III. Basis for the Requested Variance (§ 907.C.3.)**

Acrylic acid in its pure form is a listed waste due to ignitability. The treatment standard for this compound is incineration. Based upon LAC 33:V.2231.G.2.a, UPRR believes that treatment of this impacted media by incineration is technically inappropriate, resulting in the incineration of a large volume of this soil (1,500 tons) solely because it is impacted by low levels of acrylic acid (the highest residual concentration detected to date is 240 milligrams per kilogram [mg/Kg]). This equates to less than one tenth of one percent by volume of the soil even if all the soil were impacted by this concentration. In addition, the acrylic acid at the site does not exhibit the same nature as the acrylic acid utilized in the determination of the hazardous waste characteristic of ignitability. The waste material polymerized during the release, becoming a solid material, and is no longer ignitable. Although occasional exposed pieces of the polymerized material have been found at or near the surface of the ground, in the 2 years since the derailment, no acrylic acid has ignited at the site. Additionally, soil with this concentration of acrylic acid was tested for ignitability as part of the waste characterization during the initial removal operation. The soil was determined not to be ignitable.

## ARCADIS

Mr. Michael Vince  
20 May 2002

#### IV. ...Proposed Regulations or Amendments... (§ 907.C.4.)

No regulations or amendments to regulations are anticipated due to this action.

#### V. Other Information that Justifies the Proposed Action (§ 907.C.5.)

Treatment of the contaminated soil by incineration would result in concentrations of hazardous constituents (acrylic acid) that are below the concentrations necessary to minimize short and long term threats to human health and the environment. Acrylic acid exhibits non-carcinogenic effects. In accordance with LAC 33:V.2231.G.3.a.ii, ARCADIS has calculated concentration limits (attached), under Management Option – 1 (MO-1) that an individual could be exposed to on a daily basis without appreciable risk of deleterious effect during a lifetime. These MO-1 limits are based upon Screening Standard concentrations already calculated by ARCADIS, submitted in the Site Investigation Report for Eunice City Lake, and accepted by the LDEQ (also attached). The MO-1 standard (100 mg/Kg) is based on an industrial exposure scenario.

The acrylic acid that is in the soil does not readily leach from the soil. Synthetic Precipitate Leaching Procedure (SPLP) samples collected from the impacted areas of the right-of-way documented that the acrylic acid is not mobile. As shown in the Railbed Report (February 2002) the SPLP sample collected from the area of highest acrylic acid concentrations had an SPLP concentration of only 0.066 milligrams per liter (mg/L) which is three orders of magnitude below a concentration that is protective of groundwater. Therefore, landfilling of this soil will not create an environmental hazard due to the leaching of the acrylic acid.

Based upon the information provided above, UPRR proposes to dispose of soil containing concentrations of 100 mg/Kg or less of acrylic acid by direct landfilling at a Subtitle C (Hazardous Waste) landfill. Landfilling of acrylic acid contaminated soil, below the MO-1 industrial level, will remain protective of human health and the environment. UPRR proposes to dispose of the soil impacted by acrylic acid above the MO-1 concentration of 100 mg/Kg by incineration.

UPRR will comply with all applicable requirements for restricted wastes found under LAC 33:V.2245 and 2247.

### RECAP Screening Standards For Union Pacific Railroad Train Derailment

Eunice Train Derailment  
52700 - May 27, 2000  
Agency Interest No. 85276

## 1.0 Introduction

The objective of this report is to present risk-based screening standards using the equations provided in the Louisiana Department of Environmental Quality Risk Evaluation/Corrective Action Program (RECAP; LDEQ 2000; LAC 33:I.Chapter 13). RECAP Screening Standards (SS) will be used to: (1) evaluate preliminary sample quantitation limits (SQL); (2) establish an Area of Investigation (AOI) and constituents of concern (COCs) in accordance with RECAP Site Investigation requirements; and (3) provide an approach for deriving site specific RECAP Standards (RS) for the COCs after the Site Investigation activities are completed. The approach for defining AOI for the Eunice Train Derailment site is contained in the "Revised Work Plan, Environmental Site Investigation (ARCADIS Geraghty & Miller July 12, 2000) which was approved by LDEQ on July 25, 2000.

This report is concerned with the "short-list" of derailment-related COCs. The "short-list" of COCs includes the chemicals contained in the breached rail cars or surrogate chemicals identified as indicators of the presence of a chemical contained in the breached rail cars. A toxicity assessment for the COCs was conducted in order to identify appropriate toxicity values for use in calculating risk-based concentrations in soil, surface water, and edible fish tissue. To support the toxicity assessment, toxicological and environmental fate data were compiled from a technical literature review for the COCs.

Risk-based SS for non-industrial soil ( $Soil_{SS_{ni}}$ ,  $Soil_{SS_{GW}}$ , and  $Soil_{ed}$ ), groundwater ( $GW_{SS}$ ), surface water ( $SW_{NDW}$ ), and edible fish tissue (Risk-Based Concentration [RBC]) were calculated. The soil SS were calculated from equations taken directly from Appendix H and I of RECAP (LDEQ 2000). The soil SS presented herein are based on the assumption that the area of impacted soil under investigation is approximately 0.5 acre or less. If after completion of the Site Investigation the area of impacted soil is determined to be greater than 0.5 acre, the soil SS will require modification to the actual area of impacted soil.

The groundwater SS were calculated from equations taken directly from Appendix H of RECAP (LDEQ 2000). The surface water standard utilized the RECAP Management Option 1 (MO-1) equations for Groundwater Classification 3 Non-Drinking Water ( $GW3_{NDW}$ ) because the point of exposure for a  $GW3_{NDW}$  groundwater source is assumed to be at the point of discharge to a surface water body. Therefore, the  $GW3_{NDW}$  is assumed to be representative of a surface water RECAP

Agency Interest No. 85276

Standard and is also consistent with Human Health Numerical Criteria Derivations for Toxic Substances (LDEQ 1994). The RBC for edible fish tissue is based on the equation presented in the U.S. Environmental Protection Agency (USEPA) Region III Report on the development of risk-based concentrations (USEPA Region III Risk-Based Concentration Table: Technical Background Information, 1999).

The following RECAP Standards were calculated:

|                      |  |
|----------------------|--|
| Soil <sub>SSu</sub>  | The RECAP soil screening standard based on the protection of human health for non-industrial land use.   |
| Soil <sub>SSGW</sub> | The RECAP soil screening standard based on the protection of groundwater meeting the definition of Groundwater Classification 1 (compliance with GW <sub>SS</sub> ).   |
| Soil <sub>sat</sub>  | The MO-1 RECAP Standard based on the concentration that represents a chemical-physical limit where saturation of the soil occurs. Constituent concentrations in soil at or above the Soil <sub>sat</sub> indicate a potential for non-aqueous phase liquid (NAPL) to be present in the soil. |
| GW <sub>SS</sub>     | The RECAP groundwater screening standard based on the protection of groundwater meeting the definition of Groundwater Classification 1.  |
| SW <sub>NDW</sub>    | The modified surface water RECAP Standard utilizing the GW3NDW equations that assumes a point of discharge into a surface water body.  |
| RBC                  | Calculated risk-based concentrations for edible fish.  |

## 2.0 Methods

While RECAP provides screening standards for chloromethane, phenol, and 1,2-dichloropropane, no standards are available for other "short-list" COCs. Therefore, RECAP SS for such constituents were calculated using the equations provided in RECAP Appendix H and I (LDEQ 2000). The first step in preparation for doing such calculations was to compile physical and chemical information (Table 1), as well as toxicological information (Tables 2 and 3) on these constituents. Such data were obtained primarily from RECAP, USEPA Region III and Region IX documents.

Occasionally, the information needed for a specific chemical was not available. When chemical-specific dermal absorption factors (ABS) were not available, organic constituents were assumed to have an ABS of 0.1 and inorganic constituents an ABS of

52700 - May 27, 2000  
Agency Interest No. 85276

0.01, as taken from Appendix H, Table H-1 of RECAP (LDEQ 2000). Henry's Law constants were calculated with the following equation when not available:  $H = (\text{vapor pressure} \times \text{molecular weight}) / \text{solubility}$ . The equation is based on the Henry's Law Constant formula in USEPA's "Soil Screening Guidance: Technical Background Document" (USEPA 1999). The air diffusivities ( $D_i$ ) and water diffusivities ( $D_w$ ) were calculated following the formulas provided in Appendix H of RECAP.  $D_i$  and  $D_w$  were estimated using the algorithms below:

chemical a = chemical in question

chemical b = phenol (with published diffusivity value)

$$D_i = \frac{D_{ib}}{D_{ia}} = \sqrt{\frac{MW_a}{MW_b}}$$

$$D_w = \frac{D_{wb}}{D_{wa}} = \sqrt{\frac{MW_a}{MW_b}}$$

$K_{oc}$  represents the organic carbon/ water partition coefficient, and  $K_{ow}$  represents the octanol/water partition coefficient. If a  $K_{oc}$  or  $K_{ow}$  was not available in the literature, a representative value was estimated using the algorithm from Appendix I of RECAP (LDEQ 2000).

$$\text{Log } K_{oc} = 0.0784 + (0.7919 \times \text{log } K_{ow})$$

When necessary, a bioconcentration factor (BCF) was estimated using the  $K_{ow}$  and the algorithm from Appendix I of RECAP (LDEQ 2000).

$$\text{Log BCF} = 0.76 \text{ log } K_{ow} - 0.23$$

Toxicity values were also located for the constituents involved. As reported in RECAP (LDEQ 2000), toxicity values are obtained from the following hierarchy of sources: (1) USEPA's Integrated Risk Information System (IRIS), an on-line database of toxicity information updated monthly (USEPA 2000); (2) USEPA's Health Effects Assessment Summary Tables toxicological profiles (HEAST; (USEPA 1997); (3) USEPA Region III Risk-Based Concentration Tables (USEPA 1998a); or (4) USEPA Region IX Preliminary Remediation Goals Tables (USEPA 1998b). Agency Interest No. 85276

sources are presented in the References section (Section 4). Occasionally, the available toxicological information needed to be converted to a form required by RECAP Standard equations. The inhalation reference dose (RfD<sub>i</sub>) can be calculated by converting a reference concentration (RfC) for noncarcinogenic effects using the following equation found in USEPA Region IX's 1999 Preliminary Remediation Goals Report (Oct. 1, 1999).

$$RfD_i, \frac{mg}{(kg-day)} = RfC(mg / m^3) \times \frac{20m^3}{day} \times \frac{1}{70kg}$$

A similar equation was used to convert the unit risk factors (URF) for carcinogenic effects to the inhalation cancer slope factor (CSF<sub>i</sub>) using the following equation found in USEPA Region IX's 1999 Preliminary Remediation Goals Report (Oct. 1, 1999).

$$CSF_i, \frac{(kg-day)}{(mg)} = URF(m^3 / ug) \times \frac{day}{20m^3} \times 70kg \times \frac{10^3 ug}{mg}$$

### 3.0 Results

Available RECAP Standards for surface soil were utilized for the constituents that have such standards. As previously mentioned, some of the constituents do not have RECAP Standards. The soil SS for non-industrial land use (Soil<sub>SSni</sub>), the soil SS for protection of groundwater (Soil<sub>SSGW</sub>), and the soil SS for soil saturation concentration (Soil<sub>ssat</sub>) provide conservative risk-based SS for defining the AOI. The definition of AOI is critical for future applications of RECAP for corrective action options at the site. Table 4 shows the available or calculated soil standards for the COCs. Also, sample calculations for three constituents, acrylic acid, dicyclopentadiene, and 2,4-toluenediamine, are provided in Table 5.

In addition, RECAP Standards are not available for sediments. Therefore, it is proposed that using the soil SS for sediments will be protective of human health. Although surface soils found in the tributary area and adjacent wetlands at the site are saturated during certain portions of the year, the soil screening standard (SS) for non-industrial land use (Soil<sub>SSni</sub>) and the soil SS for protection of groundwater (Soil<sub>SSGW</sub>) provide conservative risk-based SS for defining the Area of Investigation (AOI).

## ARCADIS

### RECAP Screening Standards For Union Pacific Railroad Train Derailment

Eunice Train Derailment  
52700 - May 27, 2000  
Agency Interest No. 85276

Available RECAP Standards for groundwater were utilized for the constituents that have such standards. As previously mentioned, some of the constituents do not have RECAP Standards. The groundwater screening standard ( $GW_{SS}$ ) is based on the protection of groundwater meeting the definition of Groundwater Classification 1. In accordance with RECAP, the Maximum Contaminant Level (MCL; Safe Drinking Water Act) was identified as the  $GW_{SS}$  when available. If an MCL was not available, a risk-based  $GW_{SS}$  was developed using the equations provided in RECAP Appendix H (LDEQ 2000). The exposure pathways that were considered in the development of the risk-based  $GW_{SS}$  include the ingestion of groundwater and the inhalation of volatile emissions associated with indoor groundwater use. Table 6 shows the calculated  $GW_{SS}$  and sample calculations for three constituents (acrylic acid, dicyclopentadiene, and 2,4-toluenediamine) provided in Table 7.

RECAP Standards for surface water are not available. The equations for  $GW_{3NDW}$  were used to develop a risk-based surface water standard. Because the point of exposure for  $GW_{3NDW}$  groundwater is assumed to be at the point of discharge to a surface water body, it is assumed to be representative of a surface water RS. The  $GW_{3NDW}$  equations are also consistent with LDEQ Human Health Numerical Criteria Derivations for Toxic Substances (LDEQ Office of Water Resources 1994). In Table 8 the calculated  $GW_{3NDW}$  RS for surface water is referred to as Surface Water Non-Drinking Water (SWNDW). Table 9 provides sample calculations of the SWNDW standard.

RECAP Standards are also not available for fish. Therefore, to evaluate the constituent concentrations in fish collected from surface waters near the derailment area, a risk-based concentration was calculated. The RBC for edible fish tissue is based on the equation in USEPA's Region III Report on the development of risk-based concentrations (USEPA Region III Risk-Based Concentration Table: Technical Background Information, 1999). The USEPA Region III exposure assumption for fish ingestion (0.054 kg/d) was adjusted to match the RECAP input for fish ingestion (0.02 kg/d). Table 10 shows the calculated RBCs for edible fish tissue, as well as any USEPA Region III RBCs available for comparison. Sample calculations for RBCs are provided in Table 11.

If any of the calculated RECAP Standards are less than the analytical quantitation limit, the analytical reporting limit is used as the limiting Screening Standard for that specific medium (e.g., soil, groundwater, surface water, fish tissue) (LDEQ 2000). The Reporting Limits utilized are in accordance with established standard EPA approved methodologies. Reporting Limits are generally determined through application of a

multiplication factor to the statistically derived Method Detection Limit (MDL) for an individual compound. MDLs are established in accordance with protocols set forth in 40 CFR Part 136. For reporting purposes associated with this project, if a detection occurs between the MDL and the reporting limit, values will be reported with a "J" qualifier indicating that the concentration is estimated. Therefore, if a non-detect is reported, the presumption is that the compound was not reportable above the MDL. With the exception of 2,4-toluenediamine and toluene diisocyanate, all fish tissue RBCs were greater than the laboratory analytical detection limits.

mg/kg milligrams per kilogram.

NA Not available

NAP Not applicable.

RECAP Risk Evaluation/Corrective Action Program.

Soil\_sat Soil screening standard based on the concentration at which the pore spaces in the soil medium are saturated constituent of concern; from RECAP Table 2 when available.

Soil\_SSGW Soil screening standard based on the protection of groundwater meeting the definition of Groundwater Classification I, from RECAP Table 1 when available.

Soil\_SSni Soil screening standard based on the protection of human health for non-industrial land use; from RECAP Table 1 when available

(1) Soil level protective of groundwater for inorganic constituents based on GWI because TCLP value not listed.

\* Chloromethane's Soil\_SSGW In RECAP Table 1 is based on Quantitation limits, not the RECAP calculations.

+ Neopentyl glycol data was not available, therefore ethylene glycol was used as a surrogate.

Note: If the limiting Soil Screening Standard was below the analytical quantitation limits, the analytical quantitation was used as the limiting soil RECAP standard (LDEQ 2000).

 Limiting Screening Standards are shaded.

## ARCADIS

Table 5. Equations for RECAP Screening Standards for Soil and Sample Calculations for Soil, Union Pacific Derailment Site, Union Pacific Railroad Company, Eunice, Louisiana.

### Soil<sub>SSM</sub> for Noncarcinogenic Effects of Organic Constituents

$$Soil_{SSM}(mg/kg) = \frac{THQ \times BW_c \times AT_{nc} \times 365 days/yr}{EF_m \times ED_c \left[ \left( \left( \frac{1}{RfD_o} \right) \times 10^{-6} \frac{kg}{mg} \times IRS_c \right) + \left( \left( \frac{1}{RfD_i} \right) \times IRA_c \times \left( \frac{1}{VF_m} \right) \right) + \left( \left( \frac{1}{RfD_o} \right) \times SA_c \times AF_c \times ABS \times 10^{-6} \frac{kg}{mg} \right) \right]}$$

### Soil<sub>SSM</sub> for Carcinogenic Effects of Organic Constituents

$$Soil_{SSM}(mg/kg) = \frac{TR \times AT_c \times 365 days/yr}{EF_m \times \left[ \left( CSF_o \times 10^{-6} \frac{kg}{mg} \times IRS_{adj} \right) + \left( CSF_i \times IRA_{adj} \times \left( \frac{1}{VF_m} \right) \right) + \left( CSF_o \times 10^{-6} \frac{kg}{mg} \times ABS \times IRD_{adj} \right) \right]}$$

### Soil<sub>SSM</sub> for Noncarcinogenic Effects of Inorganic Constituents

$$Soil_{SSM}(mg/kg) = \frac{THQ \times BW_c \times AT_{nc} \times 365 days/yr}{EF_m \times ED_c \times \left[ \left( \left( \frac{1}{RfD_o} \right) \times 10^{-6} \frac{kg}{mg} \times IRS_c \right) + \left( \left( \frac{1}{RfD_o} \right) \times SA_c \times AF_c \times ABS \times 10^{-6} \frac{kg}{mg} \right) \right]}$$

The following formulas are for both carcinogenic and noncarcinogenic constituents:

$$VF_m(m^3/kg) = \frac{(Q/C) \times (3.14 \times D_A \times T)^{1/2} \times 10^{-4} (m^2/cm^2)}{(2 \times \rho_b \times D_A)}$$

$$D_A(cm^2/s) = \frac{[(\theta_a^{10/3} D_i H' + \theta_w^{10/3} D_w)/n^2]}{\rho_b K_d + \theta_w + \theta_a H'}$$

$$C_{soil}(mg/kg) = \frac{GW_1 \times (\rho_b \times K_d + \theta_w + \theta_a \times H')}{\rho_b}$$

## ARCADIS

Table 5. Equations for RECAP Screening Standards for Soil and Sample Calculations for Soil, Union Pacific Derailment Site, Union Pacific Railroad Company, Eunice, Louisiana.

$GW_{ss}$  for Noncarcinogenic Effects of Non-volatile Constituents

$$GW_{ss} (mg / L) = \frac{THQ \times BW_a \times AT_{mi} \times 365 days / yr}{EF_m \times ED_m \times \left( \frac{1}{RfD_o} \times IRW_a \right)}$$

$GW_{ss}$  for Noncarcinogenic Effects of Volatile Constituents

$$GW_{ss} (mg / L) = \frac{THQ \times BW_a \times AT_{mi} \times 365 days / yr}{EF_m \times ED_m \times \left( \left( \frac{1}{RfD_i} \times K_w \times IRA_a \right) + \left( \left( \frac{1}{RfD_o} \right) \times IRW_a \right) \right)}$$

$$GW_1 = GW_{ss} \times 10$$

$GW_{ss}$  for Carcinogenic Effects of Non-volatile Constituents

$$GW_{ss} (mg / L) = \frac{TR \times AT_c \times 365 days / yr}{EF_m \times (CSF_o \times IRW_{adj})}$$

$GW_{ss}$  for Carcinogenic Effects of Volatile Constituents

$$GW_{ss} (mg / L) = \frac{TR \times AT_c \times 365 days / yr}{EF_m \times [(CSF_i \times K_w \times IRA_{adj}) + (CSF_o \times IRW_{adj})]}$$

$$GW_1 = GW_{ss}$$

$$Soil_{SSGW} (mg / kg) = C_{soil} \times 20$$

## ARCADIS

Table 5. Equations for RECAP Screening Standards for Soil and Sample Calculations for Soil, Union Pacific Derailment Site, Union Pacific Railroad Company, Eunice, Louisiana.

$$Soil_{sm} (mg / kg) = \frac{S}{\rho_b} \left( (K_d \times \rho_b) + \theta_w + (H' \times \theta_a) \right)$$

Estimation of air and water diffusivities ( $D_i$  and  $D_w$ )

chemical a = chemical in question

chemical b = phenol (with published diffusivity value)

$$D_i = \frac{D_{ib}}{D_{ia}} = \sqrt{\frac{MW_a}{MW_b}}$$

$$D_w = \frac{D_{wb}}{D_{wa}} = \sqrt{\frac{MW_a}{MW_b}}$$

### SAMPLE CALCULATION : Dicyclopentadiene

Chemical a = dicyclopentadiene

Chemical b = phenol

$$D_i = \frac{0.082 cm^2 / s}{D_{ia}} = \sqrt{\frac{132.21 g / mole}{94.11 g / mole}} = 0.0692 cm^2 / s$$

$$D_w = \frac{0.0000091 cm^2 / s}{D_{wa}} = \sqrt{\frac{132.21 g / mole}{94.11 g / mole}} = 7.7 \times 10^{-6} cm^2 / s$$

$$D_A = \frac{[(0.15^{10/3} \times 0.07 cm^2 / s \times 0.0107 atm - m^3 / mol \times 41) + (0.21^{10/3} \times 7.7 \times 10^{-6} cm^2 / s) / 0.36^2]}{(1.7 g / cm^3 \times 5.364 cm^3 / g) + 0.21 + (0.15 \times 0.0107 atm - m^3 / mol \times 41)}$$

$$= \frac{4.1 \times 10^{-4}}{9.4} = 4.4 \times 10^{-5} cm^2 / s$$

$$VF_m = \frac{79.25 \times (3.14 \times 4.4 \times 10^{-5} cm^2 / s \times 1.9 \times 10^8 s)^{1/2} \times 10^{-4}}{2 \times 1.7 \times 4.4 \times 10^{-5} cm^2 / s}$$

## ARCADIS

Table 5. Equations for RECAP Screening Standards for Soil and Sample Calculations for Soil, Union Pacific Derailment Site, Union Pacific Railroad Company, Eunice, Louisiana.

$$= \frac{1.3}{0.00015} = 8620 \text{ m}^3 / \text{kg}$$

$$\begin{aligned} \text{Soil}_{\text{SSM}} &= \frac{0.1 \times 15 \times 6 \times 365}{350 \times 6 \times \left[ \left( \left( \frac{1}{3 \times 10^{-2}} \right) \times 10^{-6} \times 200 \right) + \left( \left( \frac{1}{5.7 \times 10^{-5}} \right) \times 10 \times \left( \frac{1}{8620} \right) \right) + \left( \left( \frac{1}{3 \times 10^{-2}} \right) \times 2900 \times 0.3 \times 0.1 \times 10^{-6} \right) \right]} \\ &= \frac{3285}{2100(20.4)} = 0.08 \text{ mg / kg} \end{aligned}$$

$$\begin{aligned} \text{GW}_{\text{SS}} &= \frac{0.1 \times 70 \text{ kg} \times 30 \text{ y} \times 365 \text{ days / yr}}{350 \text{ d / y} \times 30 \text{ y} \times \left[ \left( \frac{1}{6 \times 10^{-5}} \times 0.5 \text{ L / m}^3 \times 20 \text{ m}^3 / \text{day} \right) + \left( \frac{1}{3 \times 10^{-2} \text{ mg / kg} - \text{d}} \times 2 \text{ L / d} \right) \right]} \\ &= \frac{76650}{1.75 \times 10^9} = 4.4 \times 10^{-5} \text{ mg / L} \end{aligned}$$

The analytical quantitation limit for Dicyclopentadiene in groundwater is 0.01 mg/L, therefore this value was used for  $\text{GW}_1$  in the  $\text{C}_{\text{soil}}$  equation below.

$$\text{C}_{\text{soil}} = \frac{0.01 \text{ mg / L} \left( 1.7 \text{ g / cm}^3 \times 5.364 \text{ cm}^3 / \text{g} + 0.21 + 0.15 \times 0.01 \text{ atm} - \text{m}^3 / \text{mol} \times 41 \right)}{1.7 \text{ g / cm}^3} = 0.055 \text{ mg / kg}$$

$$\text{Soil}_{\text{SSM}} = 0.055 \text{ mg / kg} \times 20 = 1.11 \text{ mg / kg}$$

Dicyclopentadiene is not soluble in water, therefore the  $\text{Soil}_{\text{SSM}}$  is considered not applicable.

## ARCADIS

Table 5. Equations for RECAP Screening Standards for Soil and Sample Calculations for Soil, Union Pacific Derailment Site, Union Pacific Railroad Company, Eunice, Louisiana.

### SAMPLE CALCULATION : Acrylic Acid

Chemical a = Acrylic Acid

Chemical b = phenol

$$D_i = \frac{0.082 \text{ cm}^2 / \text{s}}{D_{ia}} = \sqrt{\frac{72.06 \text{ g / mole}}{94.11 \text{ g / mole}}} = 0.094 \text{ cm}^2 / \text{s}$$

$$D_{wi} = \frac{0.0000091 \text{ cm}^2 / \text{s}}{D_{wa}} = \sqrt{\frac{72.06 \text{ g / mole}}{94.11 \text{ g / mole}}} = 1.04 \times 10^{-5} \text{ cm}^2 / \text{s}$$

$$D_A = \frac{\left[ (0.15^{10/3} \times 0.094 \text{ cm}^2 / \text{s} \times 3.2 \times 10^{-7} \text{ atm} - \text{m}^3 / \text{mol} \times 41) + (0.21^{10/3} \times 1.04 \times 10^{-5} \text{ cm}^2 / \text{s}) / 0.36^2 \right]}{(1.7 \text{ g / cm}^3 \times 5.364 \text{ cm}^3 / \text{g}) + 0.21 + (0.15 \times 3.2 \times 10^{-7} \text{ atm} - \text{m}^3 / \text{mol} \times 41)}$$

$$= \frac{4.6 \times 10^{-7}}{0.65} = 7.1 \times 10^{-7} \text{ cm}^2 / \text{s}$$

$$VF_m = \frac{79.25 \times (3.14 \times 7.1 \times 10^{-7} \text{ cm}^2 / \text{s} \times 1.9 \times 10^8 \text{ s})^{1/2} \times 10^{-4}}{2 \times 1.7 \times 7.1 \times 10^{-7} \text{ cm}^2 / \text{s}}$$

$$= \frac{0.16}{2.4 \times 10^{-6}} = 67668 \text{ m}^3 / \text{kg}$$

$$\text{Soil}_{SS_m} = \frac{0.1 \times 15 \times 6 \times 365}{350 \times 6 \times \left[ \left( \left( \frac{1}{0.5} \right) \times 10^{-6} \times 200 \right) + \left( \left( \frac{1}{0.00029} \right) \times 10 \times \left( \frac{1}{67668} \right) \right) + \left( \left( \frac{1}{0.5} \right) \times 2900 \times 0.3 \times 0.1 \times 10^{-6} \right) \right]}$$

$$= \frac{3285}{2100(0.51)} = 3.06 \text{ mg / kg}$$

## ARCADIS

Table 5. Equations for RECAP Screening Standards for Soil and Sample Calculations for Soil, Union Pacific Derailment Site, Union Pacific Railroad Company, Eunice, Louisiana.

$$GW_{ss} = \frac{0.1 \times 70 \text{ kg} \times 30 \text{ y} \times 365 \text{ d} / \text{y}}{350 \text{ d} / \text{y} \times 30 \text{ y} \times \left( \frac{1}{0.5 \text{ mg} / \text{kg} - d} \times 2 \text{ L} / \text{d} \right)}$$

$$= \frac{76650}{42000} = 1.8 \text{ mg} / \text{L}$$

$$C_{soil} = \frac{10 \times 1.8 \text{ mg} / \text{L} \left[ \left( 1.7 \text{ g} / \text{cm}^3 \times 0.25 \text{ cm}^3 / \text{g} \right) + 0.21 + \left( 0.15 \times 3.2 \times 10^{-7} \frac{\text{atm} \cdot \text{m}^3}{\text{mol}} \times 41 \right) \right]}{1.7 \text{ g} / \text{cm}^3} = 6.963 \text{ mg} / \text{kg}$$

$$\text{Soil}_{SSGW} = 6.963 \text{ mg} / \text{kg} \times 20 = 139 \text{ mg} / \text{kg}$$

$$\text{Soil}_{sat} = \frac{1 \times 10^6 \text{ mg} / \text{L}}{1.7 \text{ g} / \text{cm}^3} \left[ \left( 0.26 \text{ cm}^3 / \text{g} \times 1.7 \text{ g} / \text{cm}^3 \right) + 0.21 + \left( 3.2 \times 10^{-7} \frac{\text{atm} \cdot \text{m}^3}{\text{mol}} \times 41 \times 0.15 \right) \right]$$

$$= 5.9 \times 10^5 (0.44 + 0.21 + 1.95 \times 10^{-6}) = 3.8 \times 10^5 \text{ mg} / \text{kg}$$

### SAMPLE CALCULATION : 2,4-Toluenediamine

Chemical a = 2,4-toluenediamine

Chemical b = phenol

$$D_i = \frac{0.082 \text{ cm}^2 / \text{s}}{D_{iu}} = \sqrt{\frac{122.17 \text{ g} / \text{mole}}{94.11 \text{ g} / \text{mole}}} = 0.072 \text{ cm}^2 / \text{s}$$

$$D_w = \frac{0.0000091 \text{ cm}^2 / \text{s}}{D_{wu}} = \sqrt{\frac{122.17 \text{ g} / \text{mole}}{94.11 \text{ g} / \text{mole}}} = 7.99 \times 10^{-6} \text{ cm}^2 / \text{s}$$

## ARCADIS

Table 5. Equations for RECAP Screening Standards for Soil and Sample Calculations for Soil, Union Pacific Derailment Site, Union Pacific Railroad Company, Eunice, Louisiana.

$$D_A = \frac{\left[ (0.15^{10/3} \times 0.072 \text{ cm}^2 / \text{s} \times 1.2 \times 10^{-9} \text{ atm} - \text{m}^3 / \text{mol} \times 41) + (0.21^{10/3} \times 7.99 \times 10^{-6} \text{ cm}^2 / \text{s}) / 0.36^2 \right]}{(1.7 \text{ g} / \text{cm}^3 \times 0.013 \text{ cm}^3 / \text{g}) + 0.21 + (0.15 \times 1.2 \times 10^{-9} \text{ atm} - \text{m}^3 / \text{mol} \times 41)}$$

$$= 1.47 \times 10^{-6} \text{ cm}^2 / \text{s}$$

$$VF_m = \frac{79.25 \times (3.14 \times 1.47 \times 10^{-6} \text{ cm}^2 / \text{s} \times 9.5 \times 10^8 \text{ s})^{1/2} \times 10^{-4}}{2 \times 1.7 \times 1.47 \times 10^{-6} \text{ cm}^2 / \text{s}}$$

$$= \frac{0.52}{5 \times 10^{-6}} = 1.05 \times 10^5 \text{ m}^3 / \text{kg}$$

$$\text{Soil}_{ssu} = \frac{10^{-6} \times 70 \times 365}{350 \times \left[ (3.2 \times 10^{-6} \times 114) + \left( 3.2 \times 11 \times \left( \frac{1}{1.05 \times 10^5} \right) \right) + (3.2 \times 10^{-6} \times 0.1 \times 504) \right]}$$

$$= \frac{0.025}{0.3025} = 0.08 \text{ mg} / \text{kg}$$

$$GW_{ss} = \frac{10^{-6} \times 70 \text{ yrs} \times 365 \text{ days} / \text{yr}}{350 \text{ d} / \text{y} \times (3.2 \times 1.1)}$$

$$= \frac{0.025}{1232} = 2.0 \times 10^{-5} \text{ mg} / \text{L}$$

The analytical quantitation limit for 2,4-Toluenediamine in groundwater is 0.02 mg/L, therefore this value was used for  $GW_1$  in the  $C_{soil}$  equation below.

$$C_{soil} = \frac{0.02 \text{ mg} / \text{L} (1.7 \text{ g} / \text{cm}^3 \times 0.013 \text{ cm}^3 / \text{g} + 0.21 + 0.15 \times 1.2 \times 10^{-9} \text{ atm} - \text{m}^3 / \text{mol} \times 41)}{1.7 \text{ g} / \text{cm}^3} = 0.00274 \text{ mg} / \text{kg}$$

## ARCADIS

mg/L Milligrams per liter.

NA Not available

NC Not a carcinogen.

RECAP Risk Evaluation/Corrective Action Program

\* The minimum value for 1,2-Dichloropropane is the MCL value according to RECAP Worksheet 3.

+ Neopentyl glycol data were not available, therefore ethylene glycol was used as a surrogate.

Note: If the GW\_SS was below the analytical quantitation limits, the analytical quantitation limit was used as the limiting groundwater RECAP standard (LDEQ 2000).

The shaded value was determined to be the limiting screening standard or the analytical quantitation limit.

## ARCADIS

Table 7. Equations for RECAP Screening Standards for Groundwater and Sample Calculations for Groundwater, Union Pacific Derailment Site, Union Pacific Railroad Company, Eunice, Louisiana.

### GW<sub>SS</sub> for Noncarcinogenic Effects of Non-volatile Constituents

$$GW_{SS} (mg / L) = \frac{THQ \times BW_a \times AT_{nni} \times 365 days / yr}{EF_n \times ED_n \times \left( \frac{1}{RfD_o} \times IRW_a \right)}$$

### GW<sub>SS</sub> for Noncarcinogenic Effects of Volatile Constituents

$$GW_{SS} (mg / L) = \frac{THQ \times BW_a \times AT_{nni} \times 365 days / yr}{EF_n \times ED_n \times \left[ \left( \frac{1}{RfD_i} \times K_w \times IRA_a \right) + \left( \left( \frac{1}{RfD_o} \right) \times IRW_a \right) \right]}$$

$$GW_1 = GW_{SS} \times 10$$

### GW<sub>SS</sub> for Carcinogenic Effects of Volatile Constituents

$$GW_{SS} (mg / L) = \frac{TR \times AT_c \times 365 days / yr}{EF_n \times \left[ (CSF_i \times K_w \times IRA_{adj}) + (CSF_o \times IRW_{adj}) \right]}$$

### GW<sub>SS</sub> for Carcinogenic Effects of Non-volatile Constituents

$$GW_{SS} (mg / L) = \frac{TR \times AT_c \times 365 days / yr}{EF_n \times (CSF_o \times IRW_{adj})}$$

$$GW_1 = GW_{SS}$$

### SAMPLE CALCULATION : Dicyclopentadiene

$$\begin{aligned}
 GW_{ss} &= \frac{0.1 \times 70 \text{ kg} \times 30 \text{ y} \times 365 \text{ days / yr}}{350 \text{ d / y} \times 30 \text{ y} \times \left[ \left( \frac{1}{6 \times 10^{-3}} \times 0.54 \text{ m}^3 \times 20 \text{ m}^3 / \text{day} \right) + \left( \frac{1}{3 \times 10^{-2} \text{ mg / kg} - \text{d}} \times 2 \text{ L / d} \right) \right]} \\
 &= \frac{76650}{1.75 \times 10^9} = 4.4 \times 10^{-5} \text{ mg / L}
 \end{aligned}$$

### SAMPLE CALCULATION : Acrylic Acid

$$\begin{aligned}
 GW_{ss} &= \frac{0.1 \times 70 \text{ kg} \times 30 \text{ y} \times 365 \text{ d / y}}{350 \text{ d / y} \times 30 \text{ y} \times \left( \frac{1}{0.5 \text{ mg / kg} - \text{d}} \times 2 \text{ L / d} \right)} \\
 &= \frac{76650}{42000} = 1.8 \text{ mg / L}
 \end{aligned}$$

### SAMPLE CALCULATION : 2,4-Toluenediamine

$$\begin{aligned}
 GW_{ss} &= \frac{10^{-6} \times 70 \text{ kg} \times 365 \text{ days / yr}}{350 \text{ d / y} \times (3.2 \times 1.1)} \\
 &= \frac{0.025}{1232} = 2.0 \times 10^{-5} \text{ mg / L}
 \end{aligned}$$

\* The minimum value for 1,2-Dichloropropane is the MCL value according to RECAP Worksheet 3  
 + Neopentyl glycol data were not available, therefore ethylene glycol was used as a surrogate

Note If the SWNDW was below the analytical quantitation limits, the analytical quantitation limit was used as the limiting groundwater RECAP standard (LDEQ 2000)

The shaded value was determined to be the limiting standard or the analytical quantitation limit

Equation taken from GW3NDW equation and is consistent with Human Health Numerical Criteria

Derivations for Toxic Substances, LDEQ 1994

noncarcinogenic

$$SWNDW = (THQ \times RfD \times BW) / (IRW_{NDW} + (BCF \times IRF))$$

carcinogenic

$$SWNDW = (TR \times BW) / (CSF \times (IRW_{NDW} + (BCF \times IRF)))$$

## ARCADIS

Table 9. Equations for RECAP Standards for Surface Water and Sample Calculations for Surface Water, Union Pacific Derailment Site, Union Pacific Railroad Company, Eunice, Louisiana.

$SW_{NDW}$  for Noncarcinogenic Effects

$$SW_{NDW} = \frac{THQ \times RfD_o \times BW_a}{IRW_{NDW} + (BCF \times IRF)}$$

$SW_{NDW}$  for Carcinogenic Effects

$$SW_{NDW} = \frac{TR \times BW_a}{CSF_o \times (IRW_{NDW} + (BCF \times IRF))}$$

When chemical-specific data were not available, the following formulas were used.

$$\text{Log}BCF = 0.76 \log K_{ow} - 0.23$$

$$\text{Log}K_{oc} = 0.0784 + (0.7919 \times \log K_{ow})$$

NA Not available.

NC Not a carcinogen.

mg/kg Milligrams per kilogram.

RBC Risk-Based Concentrations.

\* Pentane data was not available, therefore hexane was used as a surrogate.

+ Neopentyl glycol data was not available, therefore ethylene glycol was used as a surrogate.

Note: The formulas used to calculate the RBCs above are from EPA Region III.

The fish ingestion rate was adjusted to meet the values in LDEQ RECAP.

The shaded value was determined to be the limiting screening standard or the analytical quantitation limit.

## ARCADIS

Table 11. Equations for Risk-Based Concentrations for Edible Fish and Sample Calculations for Risk-Based Concentrations for Edible Fish, Union Pacific Derailment Site, Union Pacific Railroad Company, Eunice, Louisiana.

### RBC for Noncarcinogenic Effects

$$RBC = \frac{THQ \times RfD_o \times BW_a \times AT_n}{EF_r \times ED_{tot} \left( \frac{IRF}{1000 \text{ g / kg}} \right)}$$

### RBC for Carcinogenic Effects

$$RBC = \frac{TR \times BW_a \times AT_c}{EF_r \times ED_{tot} \times \left( \frac{IRF}{1000 \text{ g / kg}} \right) \times CSF_o}$$

|                   |  |                   |
|-------------------|--|-------------------|
| AT <sub>c</sub>   | Averaging time for carcinogens (days)                    | 25550 days        |
| AT <sub>n</sub>   | Averaging time for noncarcinogens (days)                 | 10950 days        |
| BW <sub>a</sub>   | Adult body weight (kg)                                   | 70 kg             |
| CSF <sub>o</sub>  | Oral cancer slope factor (mg/kg-day) <sup>-1</sup>       | chemical-specific |
| ED <sub>tot</sub> | Total exposure duration (years)                          | 30 y              |
| EF <sub>r</sub>   | Exposure frequency (days/year)                           | 350 d/y           |
| IRF               | Fisk ingestion rate (g/day)                              | 20 g/day          |
| RBC               | Risk-based concentrations (mg/kg)                        | calculated        |
| RfD <sub>o</sub>  | Oral reference dose (mg/kg-day)                          | chemical-specific |
| THQ               | Target hazard quotient (unitless)                        | 1                 |
| TR                | Target excess individual lifetime cancer risk (unitless) | 10 <sup>-6</sup>  |

## ARCADIS

Table 11. Equations for Risk-Based Concentrations for Edible Fish and Sample Calculations for Risk-Based Concentrations for Edible Fish, Union Pacific Derailment Site, Union Pacific Railroad Company, Eunice, Louisiana.

### Sample Calculation : Dicyclopentadiene

$$RBC = \frac{1 \times 0.03 \frac{mg}{kg-d} \times 70 kg \times 10950 d}{350 d / yr \times 30 y \times \left( \frac{20 g / day}{1000 g / kg} \right)} = 110 mg / kg$$

### Sample Calculation : Acrylic Acid

$$RBC = \frac{1 \times 0.5 \frac{mg}{kg-d} \times 70 kg \times 10950 d}{350 d / yr \times 30 y \times \left( \frac{20 g / day}{1000 g / kg} \right)} = 1825 mg / kg$$

### Sample Calculation : 2,4-Toluenediamine

$$RBC = \frac{10^{-6} \times 70 kg \times 25550 days}{350 d / yr \times 30 y \times \left( \frac{20 g / day}{1000 g / kg} \right) \times 3.2 \left( \frac{mg}{kg-day} \right)^{-1}} = 0.003 mg / kg$$
